Section 5B

The component diagram:

Architecture selection:

We chose **Microservices Architecture** for the Automated Rubric Assignment Evaluator.

Reasons:

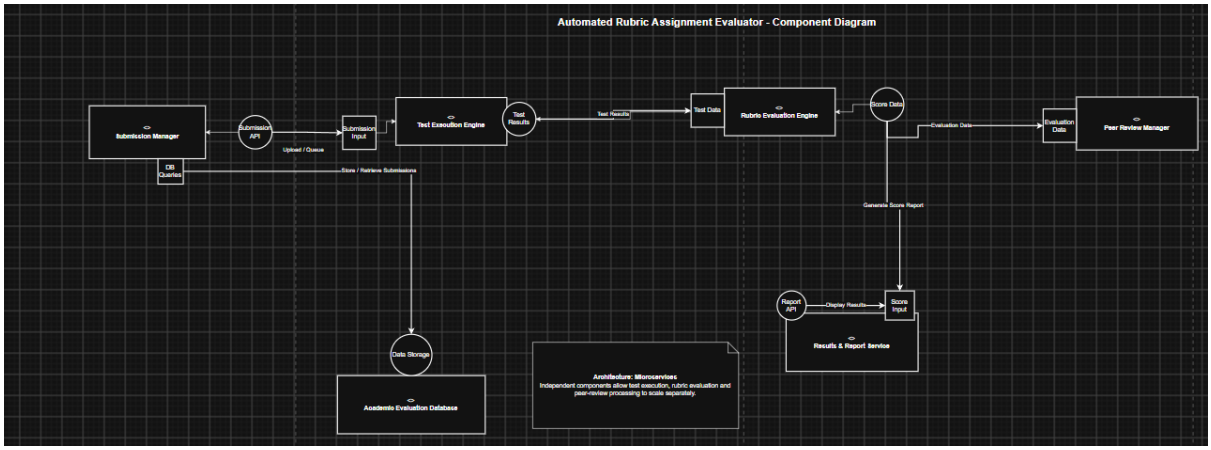

• Independent components such as test execution, rubric evaluation, and peer-review assignment can be developed and scaled separately.

• Failure in one service, such as the test execution engine, can be isolated without bringing down the entire evaluation system.

Security advantage: Student submissions can be isolated and executed within a controlled service, reducing the risk of malicious or faulty code affecting other system components.

Performance Benefit: Test execution and rubric evaluation can be scaled independently during periods when many students submit projects simultaneously,

improving throughput and reducing processing delays.

(A more systemetacially arranged components but words are not visbile)
